# The Law of Unintended Consequences

Stephen Kamelgarn, M.D.

One of the great constants in our world is the multiplicity of effects that seemingly simple actions precipitate. A car having a flat tire on the freeway can lead to a traffic jam that lasts for hours, for example.

Medicine and medical care are full of these unintended consequences, and this is especially true of medication effects. For example the development of statins for treating high cholesterol has led to major breakthroughs in treating cardiac and lipid disorders. But now it seems that these same medications also predispose people to getting diabetes, another disorder that leads to cardiac disease. The use of medications like Nexium and Prevacid for treating acid reflux also seems to predispose to getting heart disease. I could go on forever on the adverse effects of different medications.

However, the Law of Unintended Consequences holds true for medical practice itself. Medicine is an inexact science, at best. A good practitioner relies on a combination of personal knowledge, scientific consensus and intuition to arrive at a correct diagnosis and treatment plan. Unfortunately, these skills are becoming increasingly undervalued in today's medico-economic climate of profit above all else. This has led us to a point today in which for profit companies, some of which are listed on major stock exchanges, have opened thousands of for profit clinics across the country. In these clinics financial gain is the only motive, overriding the clinical judgement of the practitioners and the

real needs of the patient.

One of the unintended consequences of this business model is that "the customer is always right." Therefore, the patient satisfaction survey is the primary (and sometimes only) performance metric in judging physician effectiveness. Often, a second priority, is the selling of additional products within the clinic store. These two priorities matter far more than an effective treatment plan, or other, larger concerns, such as stemming antibiotic resistance induced by inappropriate antibiotic prescribing. Patients will go into these clinics with a viral illness, but will almost always leave with a prescription for an antibiotic for their sore throat, earache or other cold symptoms. Not only is this bad medicine, it is bad public health as we're finding more and more antibiotic resistant organisms, organisms that cause real disease and harm. But that doesn't matter. The patient demands something or it will reflect poorly in the almighty patient satisfaction survey.

Practitioners in these clinics may have the best of intentions but they feel tremendous pressure from the patients who come to see them that "they want what they want." They feel this pressure because their employers do nothing to deflect it. In fact, many practitioners feel that these pressures are amplified by those who sign their paychecks. Out of a perceived eagerness for profit, the complexity of human health and illness is compressed into fragmented encounters and simplistic algorithms in medical decision support systems. When the ethics of such processes aren't given

complete consideration, the unintended consequences can be substantial.

Inappropriate prescribing costs caused by improper and unnecessary use of medicines exceeded \$200 billion in 2012, according to IMS Institute for Healthcare Informatics estimates. This amount is equal to 8% of the nation's healthcare spending that year, and would be sufficient to pay for the healthcare of more than 24 million currently uninsured citizens.

Not only is this expensive, it also turns out that satisfied patients are not healthy patients. They spend the most on healthcare and prescription drugs. If a physician will order up antibiotics or pain meds or MRI's for no good reason other than improving his patient satisfaction scores, then costs and utilization are bound to go up. Physicians will have higher satisfaction scores when they give the patients whatever they (the patients) want whenever a patient asks for it.

Much of this is being driven by direct-to-consumer advertising on the part of the drug companies. Patients have heard about "the purple pill," and they want it, even if they don't know what it's used for. They just know that they'll get better if the physician gives them a "Z-pack" for their upper respiratory viral illness. They're convinced that their uncomplicated low back pain requires an MRI.

But practitioners who cave to patient demands are not helping the patient. Patients who are treated this

***"Opinion", Continued on Pg 21  
North Coast Physician***

**“Opinion”, Continued From Pg. 4**

way are more likely to be admitted to the hospital and are more likely to die, than their counterparts who are treated appropriately irrespective of their wants. This doesn't include the fact that we are also witnessing a huge increase in the numbers of people having infections caused by antibiotic resistant organisms, and much of this can be traced to the inappropriate use of antibiotics for the past 60 years. And we do this for the mere sake of a patient satisfaction survey? That's crazy. We all wish to be liked, but medicine isn't a popularity contest. It's an interaction between patient and physician to achieve health.

Meanwhile, the profits of the for-profit clinics go up, the US economy has a huge expense, and the health of our citizens is no better, if not worse, when it was before we adopted the profit-at-all-costs model of medical care. That is the ultimate unintended consequence.

shrugged. He admitted that he was feeling physically better than he had now that the chemotherapy was cleared out, and that he was more relaxed with his daughter in the other room and hospice available anytime. "They are great, and a big relief."

A millennial voice was also recently heard. That of Brittany Maynard, the 29-year-old Californian woman who relocated to Oregon to complete her life on her own terms with a legal and lethal prescription. In the last few weeks of her life, she pulled back the curtains and shared the experience of a modern death with a society that has had the habit of averting its gaze from such common experiences. With this act of empowerment and resolve, she has electrified the social discourse around self-determination and dignity, spurring California's End of Life Option legislation. The bill was signed into law recently by a circumspect Governor Jerry Brown, and the landscape of self-determination was transformed.

His daughter thought he was too weak to make his way across the house to the cabinet where the medicines were kept. She had thought this thought because of hints and sideways remarks about "pointlessness." Don would never be described as "patient," she told me. In the dark and quiet of the night, he got up and did make what must have been an epic and lonely journey. He got all the pills, returned to his recliner, and removed his high flow oxygen before swallowing dozens of tablets. Alone.

For the last fifteen years, I have been a specialist in the field of palliative care and hospice. I have accompanied thousands of people and their families in the face of severe illness and a system of care that often fails to even avoid making their experience worse. I am a

beginner. There have always been so many more people than there are teams of palliative care and hospice professionals to care for them, and this will be the case for decades. Even with the best palliative care and hospice support, we observe profound suffering, and we are often powerless to offer anything more than being there. That's usually enough. But sometimes, it's not even close.

As I move into a future where folks like Don and his daughter don't have to be alone as they contemplate and choose their own path, my own sense of humility and respect for the people that seek my care continues to grow. When it comes right down to it, I trust people to know the path forward for themselves and I am honored that they allow me to accompany them.

This is a remarkable moment for our society for reasons far beyond any legislation. We are awakening to the truth of things. We are beginning to realize that the measure of us may have something to do with how we care for each other in our most difficult moments and how we address the deepest challenges faced by our society and our planet.

Perhaps, if we can begin to live life as if we won't live forever, we can create a better world to live in and to die from.

# The Strange Landscape of Living and Dying in the United States

Michael Fratkin, M.D.,  
*Resolution Care*

The extraordinary pain of many people around you is unaddressed, and the scale of that unmet need would shock you if you saw it. Compartments of privacy separate you from the experience of your neighbors and even your own families. I understand that you have been unaware as well as hopeful that our medical system will either fix the problems or, at least, soothe the pain. It does neither consistently. The grappling of human beings to make sense out of the fact that they die has only been hiding in plain sight for a short time, and our society is awakening. That is both good news and a difficult truth.

Don was a Adamn good@ bookkeeper, he told me at our first palliative care visit in his home, and an amazing father according to his daughter. Don wished he hadn't smoked the way he had, but 438,000 cigarettes later, he had widespread lung cancer. Taking a shot with palliative chemotherapy, neither of us had much confidence it would deliver value.

It's a fair estimate that 107 billion people have been born in about 140,000 years of human history.... the mothers and fathers of us all. Our modern medical system is less than 100 years old. Through technology and deepening understanding of our biology, lifespans are extended and the quality of life for most of us currently living is enhanced ...for a while.

And yet, when we actually begin to complete our lives we do so without the simple things we need. For nearly all of human history, dying was no surprise as it occurred in close proximity to our living. In our modern system, we have hidden it away in hospitals, nursing homes and behind the closed doors of neighbors we don't really know very well. The structures of coping were family and community, supported by the best efforts of those possessing certain skills directed at soothing the process without any illusions about changing the outcome. With such support, people died well, in peace, and with context. While our modern medical system brings enormous value to us while we navigate the beginning and the middle of our lives, it is an open secret that people have never suffered as badly as they do now as they complete their lives.

His weight continued to peel off, and even one cycle of chemotherapy was a "nightmare." He accepted hospice without a lot of fanfare. With a long and short acting opiate, and a whiff of lorazepam at bedtime, his pain and breathlessness were well controlled despite increasing oxygen requirements. He got to work on "closing the books" and his daughter moved in.

A dynamic conversation about care for people with serious illness and those approaching death is exploding

nearly everywhere in our society. From outside my field of palliative medicine, there is the work of Ellen Goodman and the Conversation Project, the intimate chronicles of Oliver Sacks last days in the New York Times, and the Institute of Medicine's sentinel report on "Dying in America." Atul Gawande with his bestseller, *Being Mortal*, offers his own awakening to the terrible truth of how our system of medicine fails to deliver the care needed and perpetuates the flimsy idea that we can fix anything.

From within the health care system, decades of effort from the likes of physician/author Ira Byock and trailblazing physician/ leader Diane Meier, as well as thousands of dedicated and inspired professionals, are bearing fruit to bring Palliative Care to central relevancy in discussions of health care delivery and reform. Baby Boomers like myself are being confronted with the truth of aging, the limits of technology, and the waste of a system that is doing exactly what it is designed to do. In his recent TED talk, BJ Miller put it simply, "Health care was designed with diseases at its center, not people. Which is to say that it is badly designed."

As the weeks unfolded, Don's world got smaller as he spent more time with the TV off instead of on. When I asked him about his process, he
